TITLE:

On Some Controversial Problems of Geological History and Rock Classification in Engineering Geology ( O nekotorykh spornykh voprosakh geologicheskoy istorii i podrazdeleniy porod v inzhenernoy geologii)

PERIODICAL:

Byulleten' Moskovskogo Obshchestva Ispytateley Prirody, Otdel Geologicheskoy, 1957, # 6, pp 147-148 (USSR)

ABSTRACT:

The author discusses some problems of surface sediment origination and changes in climate. His conclusion is that climate plays a decisive role in the formation of surface sediments. A definite combination of genetic types of sediments and relief shapes, a definite mineralo-petrographic composition, and definite physico-mechanical properties characterize each formation of sediments: glacial, periglacial, and alluvial (pre-glacial and post-glacial).

The groups of grounds with similar engineering-geological properties must be classified on the basis of the study of their formation and facial peculiarities.

TITLE: Standard subprograms for computing elementary functions to four decimal places

CITED SOURCE: Tr. Vy\*chisl. tsentra. Tartusk. un-t, vy\*p. 3, 1963, 3-28

TOPIC TAGS: elementary function, standard computer program, automatic computation, automatic programming, decimal to binary conversion, binary to decimal conversion

TRANSLATION: A number of standard programs are proposed for computing elementary functions with an accuracy of  $5 \times 10^{-5}$ . Taylor series expansions or approximations of Chebyshev polynomials are used. All programs work with a fixed decimal and satisfy the requirements of the compiling program. The programs introduced into the machine by use of the compiling program with an initial start are described in detail. As examples of programs of the first type, programs are described for converting a number from decimal to binary systems and from binary

Title : Experimental Clinical Data on the Diagnostic Evaluation of Reactions to Concealed Blood in the Feces.

Orig Pub : Sov. meditsina, 1957, No 4, 103-106

Abstract : Eleven 17-23 years old male patients displaying symptoms of an "epigastric pain syndrome" but without symptoms of an organic gastrointestinal disease were examined for a period of 5-7 days. During this period concealed blood was not found in their feces. All of the patients received infusions of 5-400 ml of banked blood each, which was administered to them through a feeding tube, to some patients into the stomach, and to others into the duodenum. Blood in amounts of less than 10 ml was absorbed
